

Prompt 4

Caleb McLemore

September 29, 2019

Mathematical Statistics 1

This course deals with decision theory, estimation, confidence intervals, and hypothesis testing. It introduces large sample theory, asymptotic efficiency of estimates, exponential families, and sequential analysis.

Theorem 1 (Binomial Coefficients). $(x + y)^n = \sum_{r=0}^n \binom{n}{r} x^{n-r} y^r$ for any positive integer n .

[1]

Theory of Interest

The purpose of this course is to recognize, understand, and compute problems relating to time value of money, including simple and compound interest, present and future value, and nominal and effective rates of interest.

Definition 1 (The Effective Rate of Discount). *The effective rate of discount, denoted by d , is defined as a measure of interest paid at the beginning of the period.*

Formula:

$$d_n = \frac{A(n) - A(n-1)}{A(n)} = \frac{I(n)}{A(n)}$$

[2].

Linear Algebra

The basics of this course include learning how to analyze data, compute area and perimeter, use linear models and equal ratios, compare ratios, calculate unit rates and slope ratios, use the triangle inequality and the Pythagorean theorem.

Corollary 1 (Linear Independence of Subset). *Let V be a vector space and $S_1 \subseteq S_2 \subseteq V$. If S_2 is linearly independent, then S_1 is linearly independent.*

[3].
